PROJECT DESIGN PHASE-II

Data Flow Diagram & User Stories

Team Enrollment Confirmation – Import Data using Transform Maps (Spreadsheet)

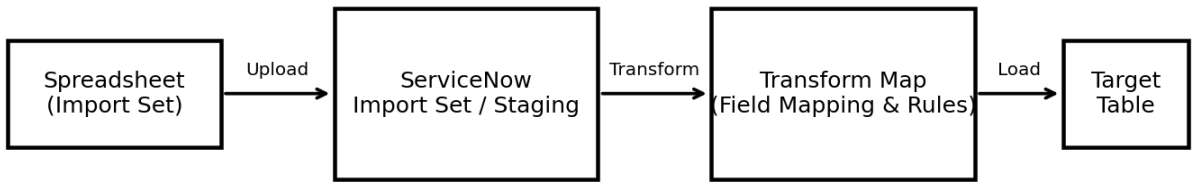

Date: 30 September 2026

Team ID	SWTID-2026-8331
Team Size	4
Team Leader	SRIKAVI T
Team Member	ISWARYA S
Team Members	YOGASRI S; KEERTHIKA L

1. Data Flow Diagram

A Data Flow Diagram (DFD) provides a clear graphical representation of how information enters, is processed, transformed, and stored in a system. For this project, the DFD represents the flow of spreadsheet data through the import process and Transform Map into the target table.

Data Flow Diagram – Import Data Using Transform Maps

Errors / rejected rows can be reviewed from the import process before completion.

Flow summary: the spreadsheet is uploaded as import data, the records are staged, Transform Map rules map source fields to target fields, and the transformed records are loaded into the target table. Invalid or rejected records can be reviewed and corrected.

2. User Stories

Following the user-story structure in the provided reference, the table below lists functional requirements, user stories, acceptance criteria, priority, and release/sprint.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
Team Member	Spreadsheet Import	USN-1	As a team member, I can upload the enrollment spreadsheet into the import process.	The spreadsheet is accepted and the import set is created successfully.	High	Sprint-1
Team Member	Data Validation	USN-2	As a team member, I can validate the imported spreadsheet data before transformation.	Required fields and invalid records are identified for review.	High	Sprint-1

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
Team Member	Transform Map	USN-3	As a team member, I can map spreadsheet source fields to the required target-table fields.	Each required source field is mapped to the correct target field.	High	Sprint-1
Team Member	Transform Rules	USN-4	As a team member, I can apply transformation rules to imported values.	Configured rules transform the source values correctly before loading.	High	Sprint-2
Team Member	Import Execution	USN-5	As a team member, I can run the Transform Map and load valid records into the target table.	Valid records are inserted/updated in the target table and processing completes without mapping errors.	High	Sprint-2
Team Member	Error Handling	USN-6	As a team member, I can identify records rejected during transformation.	Rejected records and relevant error information are available for correction.	Medium	Sprint-2
Administrator	Data Verification	USN-7	As an administrator, I can verify that transformed enrollment data is present in the target table.	Loaded records match the expected transformed values and required fields.	Medium	Sprint-3
Administrator	Process Completion	USN-8	As an administrator, I can confirm successful completion of the spreadsheet import process.	Import status is available and successfully processed records can be verified.	Medium	Sprint-3

3. Acceptance Criteria Summary

• Spreadsheet upload must create/import the source records for processing.

• Required fields and invalid values should be identifiable before final loading.

• Transform Map field mappings must correspond to the intended target fields.

• Transformation rules must produce the expected target values.

• Valid records must be loaded into the target table.

• Rejected records and processing errors must be reviewable.

• Administrators must be able to verify the completed import.

4. Conclusion

The proposed DFD and user stories describe the spreadsheet-based import workflow using Transform Maps. They provide a structured view of data movement, transformation, validation, loading, and verification, while defining the expected functionality for team members and administrators.

Reference Basis

This document follows the structure and terminology of the supplied reference document, “Project Design Phase-II – Data Flow Diagram & User Stories,” including its DFD explanation and user-story table format.
